## 1.2 Description

The UnilC HXMSH8GE13A1F1V-16KI module family are Industrial VLP ECC Unbuffered DIMM modules with 18.75mm height based on DDR3 technology. DIMMs are available in 1024M × 72 (8GB) in organization and density, intended for mounting into 240-pin connector sockets.

The memory array is designed with 4 Gbit Double-Data-Rate-Three (DDR3) Synchronous DRAMs. Decoupling capacitors are mounted on the PCB board. The DIMMs feature serial presence detect based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and are write-protected; the second 128 bytes are available to the customer.

## 2 Pin Configurations

### 2.1 Pin Configurations

The pin configuration of the 240-Pin Industrial VLP ECC Unbuffered DDR3 SDRAM DIMM is listed by function in **Table 5** (240 pins). The abbreviations used in columns Pin Type and Buffer Type are explained in **Table 6** and **Table 7** respectively. The Pin numbering is depicted in **Figure 1**

Pin Configuration of U-DIMM				
Pin No.	Name	Pin Type	Buffer Type	Function
<b>Clock Signals</b>				
184	CK0	I	SSTL	<b>Clock Signals CK0-1, Complement Clock Signals bCK0-1</b> The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and the falling edge of bCK. A Delay Locked Loop (DLL) circuit is driven from the clock inputs and output timing for read operations is synchronized to the input clock.

50	CKE0	I	SSTL	
169	CKE1	I	SSTL	<b>Clock Enable Rank 1:0</b> Activates the DDR3 SDRAM CK signal when HIGH and deactivates the CK signal when LOW. By deactivating the clocks, CKE LOW initiates the Power Down Mode or the Self Refresh Mode. <i>Note: 2 Ranks module</i>

<b>Control Signals</b>				
193	bS0	I	SSTL	<b>Chip Select Rank 1:0</b> Enables the associated DDR3 SDRAM command decoder when LOW and disables the command decoder when HIGH. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by bS0; Rank 1 is selected by bS1. Rank 2 is selected by bS2; Rank 3 is selected by bS3. Ranks are also called "Physical banks".

73	bWE	I	SSTL	<b>Write Enable</b>

190	BA1	I	SSTL	
52	BA2	I	SSTL	
188	A0	I	SSTL	<b>Address Bus 11:0</b> During a Bank Activate command cycle, defines the row address when sampled at the cross-point of the rising edge of CK and falling edge of bCK. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of bCK. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is HIGH, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is LOW, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is HIGH, all banks will be precharged regardless of the state of BA0-BAn inputs. If AP is LOW, then BA0-BAn are used to define which bank to precharge.

<b>Data Strobe Signals</b>				
7	DQS0	I/O	SSTL	<b>Data Strobe Bus 7:0 and Complementary Data Strobe Bus 7:0</b> The data strobes, associated with one data byte, sourced with data transfers. In Read mode the data strobe is sourced by the DDR3 SDRAM and is sent at the leading edge of the data window. bDQS signals are complements, and timing is relative to the cross-point of respective DQS and bDQS. If the module is to be operated in single ended strobe mode, all bDQS signals must be tied on the system board to VSS and DDR3 SDRAM mode registers programmed appropriately

## 3 General Description

### 3.1 General Description

DDR3 SDRAM modules are high-speed, CMOS dynamic random access memory modules that use internally configured 4 or 8-bank DDR3 SDRAM devices. DDR3 SDRAM modules use DDR architecture to achieve high-speed operation. DDR3 architecture is essentially a  $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single  $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding  $n$ -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

DDR3 modules use two sets of differential signals: DQS, DQS# to capture data and CK and CK# to capture commands, addresses, and control signals. Differential clocks and data strobes ensure exceptional noise immunity for these signals and provide precise crossing points to capture input signals. A bidirectional data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR3 SDRAM device during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR3 SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

### 3.2 Serial Presence-Detect EEPROM Operation

DDR3 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by UniIC to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I2C bus using the DIMM's SCL (clock) SDA (data), and SA (address) pins. Write protect (WP) is connected to VSS, permanently disabling hardware write protection.

### 4.1 Absolute Maximum Ratings

**Attention: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.**

**TABLE 8**  
Absolute Maximum Ratings

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	-0.4	+1.975	V	
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	-0.4	+1.975	V	
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4	+1.975	V	

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to integrated circuit.

**TABLE 9**

Parameter	Symbol	Values		Unit	Note
		Min.	Max.		
Operating temperature (ambient)	$T_{OPR}$	-40	+65	°C

**DRAM Component Operating Temperature Range**

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$T_{CASE}$	Operating Temperature	-40	95	°C	1)2)3)4)

- 1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
- 2) The operating temperature ranges are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between -40 ~95 °C under all other specification parameters.
- 3) Above 85 °C the Auto-Refresh command interval has to be reduced to  $t_{REFI} = 3.9 \mu s$
- 4) When operating this product in the 85 °C to 95 °C  $T_{CASE}$  temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to "1". When the High Temperature Self Refresh is enabled there is an increase of  $I_{DD6}$  by approximately 50%
