## 1.2 Description

The UnilC HXMSH2GS03A2F1CL16K module family is Low Power Small Outline DIMM modules with 30 mm height based on DDR3 technology. DIMMs are available in 256M × 64 (2GB) in organization and density, intended for mounting into 204-pin connector sockets.

The memory array is designed with 2 Gbit Double-Data-Rate-Three (DDR3) Synchronous DRAMs. Decoupling capacitors are mounted on the PCB board. The DIMMs feature serial presence detect based on a serial E<sup>2</sup>PROM device using the 2-pin I<sup>2</sup>C protocol. The first 128 bytes are programmed with configuration data and are write-protected; the second 128 bytes are available to the customer.

## 2 Pin Configurations

### 2.1 Pin Configurations

The pin configuration of the 204-Pin Small Outline DDR3 SDRAM DIMM is listed by function in [Table 5](#) (204 pins). The abbreviations used in columns Pin Type and Buffer Type are explained in [Table 6](#) and [Table 7](#) respectively. The Pin numbering is depicted in [Figure 1](#)

**TABLE 5**  
Pin Configuration of SO-DIMM

Symbol	Type	Description
Ax	Input	<b>Address inputs:</b> Provide the row address for ACTIVE commands, and the column address and auto precharge bit (A10) for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW, bank selected by BAx) or all banks (A10 HIGH). The address inputs also provide the op-code during a LOAD MODE command. See the Pin Assignments Table for density-specific addressing information.
BAx	Input	<b>Bank address inputs:</b> Define the device bank to which an ACTIVE, READ, WRITE, or PRECHARGE command is being applied. BA define which mode register (MR0, MR1, MR2, or MR3) is loaded during the LOAD MODE command.
CKx, CKx#	Input	<b>Clock:</b> Differential clock inputs. All control, command, and address input signals are sampled on the crossing of the positive edge of CK and the negative edge of CK#.
CKEx	Input	<b>Clock enable:</b> Enables (registered HIGH) and disables (registered LOW) internal circuitry and clocks on the DRAM.
DMx	Input	<b>Data mask (x8 devices only):</b> DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH, along with that input data, during a write access. Although DM pins are input-only, DM loading is designed to match that of the DQ and DQS pins.
ODTx	Input	<b>On-die termination:</b> Enables (registered HIGH) and disables (registered LOW) termination resistance internal to the DDR3 SDRAM. When enabled in normal operation, ODT is only applied to the following pins: DQ, DQS, DQS#, DM, and CB. The ODT input will be ignored if disabled via the LOAD MODE command.
Par_In	Input	<b>Parity input:</b> Parity bit for Ax, RAS#, CAS#, and WE#.
RAS#, CAS#, WE#	Input	<b>Command inputs:</b> RAS#, CAS#, and WE# (along with S#) define the command being entered.
RESET#	Input (LVCMOS)	<b>Reset:</b> RESET# is an active LOW asynchronous input that is connected to each DRAM and the registering clock driver. After RESET# goes HIGH, the DRAM must be reinitialized as though a normal power-up was executed.
Sx#	Input	<b>Chip select:</b> Enables (registered LOW) and disables (registered HIGH) the command decoder.
SAx	Input	<b>Serial address inputs:</b> Used to configure the temperature sensor/SPD EEPROM address range on the I <sup>2</sup> C bus.

SCL	Input	<b>Serial clock for temperature sensor/SPD EEPROM:</b> Used to synchronize communication to and from the temperature sensor/SPD EEPROM on the I <sup>2</sup> C bus.
CBx	I/O	<b>Check bits:</b> Used for system error detection and correction.
DQx	I/O	<b>Data input/output:</b> Bidirectional data bus.
DQSx, DQSx#	I/O	<b>Data strobe:</b> Differential data strobes. Output with read data; edge-aligned with read data; input with write data; center-aligned with write data.

Symbol	Type	Description
SDA	I/O	<b>Serial data:</b> Used to transfer addresses and data into and out of the temperature sensor/SPD EEPROM on the I <sup>2</sup> C bus.
TDQSx, TDQSx#	Output	<b>Redundant data strobe (x8 devices only):</b> TDQS is enabled/disabled via the LOAD MODE command to the extended mode register (EMR). When TDQS is enabled, DM is disabled and TDQS and TDQS# provide termination resistance; otherwise, TDQS# are no function.
Err_Out#	Output (open drain)	<b>Parity error output:</b> Parity error found on the command and address bus.
EVENT#	Output (open drain)	<b>Temperature event:</b> The EVENT# pin is asserted by the temperature sensor when critical temperature thresholds have been exceeded.
V <sub>DD</sub>	Supply	<b>Power supply:</b> 1.5V ±0.075V. The component V <sub>DD</sub> and V <sub>DDQ</sub> are connected to the module V <sub>DD</sub> .
V <sub>DDSPD</sub>	Supply	<b>Temperature sensor/SPD EEPROM power supply:</b> 3.0–3.6V.

## 3 General Description

### 3.1 General Description

DDR3 SDRAM modules are high-speed, CMOS dynamic random access memory modules that use internally configured 4 or 8-bank DDR3 SDRAM devices. DDR3 SDRAM modules use DDR architecture to achieve high-speed operation. DDR3 architecture is essentially a  $8n$ -prefetch architecture with an interface designed to transfer two data words per clock cycle at the I/O pins. A single read or write access for the DDR3 SDRAM module effectively consists of a single  $8n$ -bit-wide, one-clock-cycle data transfer at the internal DRAM core and eight corresponding  $n$ -bit-wide, one-half-clock-cycle data transfers at the I/O pins.

DDR3 modules use two sets of differential signals: DQS, DQS# to capture data and CK and CK# to capture commands, addresses, and control signals. Differential clocks and data strobes ensure exceptional noise immunity for these signals and provide precise crossing points to capture input signals. A bidirectional data strobe (DQS, DQS#) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR3 SDRAM device during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR3 SDRAM modules operate from a differential clock (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Commands (address and control signals) are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

### 3.2 Serial Presence-Detect EEPROM Operation

DDR3 SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by UniIC to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I2C bus using the DIMM's SCL (clock) SDA (data), and SA (address) pins. Write protect (WP) is connected to VSS, permanently disabling hardware write protection.

## 4 Electrical Characteristics

This chapter contains speed grade definition, AC timing parameter and ODT tables.

### 4.1 Absolute Maximum Ratings

**Attention: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.**

**TABLE 8**  
Absolute Maximum Ratings

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$V_{DD}$	Voltage on $V_{DD}$ pin relative to $V_{SS}$	-0.4	+1.975	V	
$V_{DDQ}$	Voltage on $V_{DDQ}$ pin relative to $V_{SS}$	-0.4	+1.975	V	
$V_{IN}, V_{OUT}$	Voltage on any pin relative to $V_{SS}$	-0.4	+1.975	V	

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to integrated circuit.

**TABLE 10**

**DRAM Component Operating Temperature Range**

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
$T_{CASE}$	Operating Temperature	0	95	°C	1)2)3)4)

- 1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
- 2) The operating temperature ranges are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between 0 - 95 °C under all other specification parameters.
- 3) Above 85 °C the Auto-Refresh command interval has to be reduced to  $t_{REFI} = 3.9 \mu s$
- 4) When operating this product in the 85 °C to 95 °C  $T_{CASE}$  temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to "1". When the High Temperature Self Refresh is enabled there is an increase of  $I_{DD6}$  by approximately 50%

Parameter	Symbol	Note <sup>1)2)3)4)5)</sup>
<b>Self-Refresh Current</b> CKE $\leq$ 0.2 V; external clock off, CK and $\overline{\text{CK}}$ at 0 V; Other control and address inputs are FLOATING, Data bus inputs are FLOATING. $I_{\text{DD6}}$ current values are guaranteed up to $T_{\text{CASE}}$ of 85 °C max.	$I_{\text{DD6}}$	
<b>All Bank Interleave Read Current</b> All banks are being interleaved at minimum $t_{\text{RC}}$ without violating $t_{\text{RRD}}$ using a burst length of 4. Control and address bus inputs are STABLE during DESELECTS. $I_{\text{out}} = 0$ mA.	$I_{\text{DD7}}$	<sup>6)</sup>

1)  $V_{\text{DDQ}} = 1.35 \text{ V} \pm 0.1 \text{ V}$ ;  $V_{\text{DD}} = 1.35 \text{ V} \pm 0.1 \text{ V}$

2)  $I_{\text{DD}}$  specifications are tested after the device is properly initialized and  $I_{\text{DD}}$  parameter are specified with ODT disabled.

3) Definitions for  $I_{\text{DD}}$  see **Table 16**

4) For two rank modules: All active current measurements in the same  $I_{\text{DD}}$  current mode. The other rank is in  $I_{\text{DD2P}}$  Precharge Power-Down Mode.

5) For details and notes see the relevant UnilC component data sheet.

6)  $I_{\text{DD1}}$ ,  $I_{\text{DD4R}}$  and  $I_{\text{DD7}}$  current measurements are defined with the outputs disabled ( $I_{\text{OUT}} = 0$  mA). To achieve this on module level the output buffers can be disabled using an EMRS(1) (Extended Mode Register Command) by setting A12 bit to HIGH.

**TABLE 15**  
Definitions for  $I_{\text{DD}}$

Parameter	Description
LOW	$V_{\text{IN}} \leq V_{\text{IL(ac).MAX}}$ , HIGH is defined as $V_{\text{IN}} \geq V_{\text{IH(ac).MIN}}$
STABLE	Inputs are stable at a HIGH or LOW level.
FLOATING	Inputs are $V_{\text{REF}} = V_{\text{DDQ}} / 2$
SWITCHING	Inputs are changing between HIGH and LOW every other clock (once per 2 cycles) for address and control signals, and inputs changing between HIGH and LOW every other data transfer (once per cycle) for DQ signals not including mask or strobes.
